

ASPIRATSION SINDROMDAN NOBUD BO'LGAN CHAQALOQLAR BUYRAGINING MORFOLOGIK O'ZGARISHLARI

Egamov Bunyodbek Jumanazarovich, Salaeva Zulfiya Shanazarovna
Toshkent tibbiyot akademiyasi Urganch filiali, Urganch, O'zbekiston

Ishning maqsadi tug'ruqdan keyingi erta hamda kechki neonatal davrda aspiratsion sindromdan vafot etgan chaqaloqlar buyragining postnatal ontogenezdagi rivojlanishining o'ziga xos morfologik o'zgarishlarini kuzatish.

Tadqiqot ob'ekti va predmeti. Respublika patologik anatomiya markazida 2020-2023 yillardagi tug'ruqdan keyingi neonatal davrda jami 48 nafar neonatal davrning erta (0-7 kunlik) davrida nobud bo'lgan chaqaloqlar va nobud bo'lgan chaqaloqlarning buyrak to'qimasi materiallari olingan.

Olingan natijalar. 7 kungacha bo'lgan davrda aspiratsion sindrom bilan kasallangan chaqaloqlar buyragi gipoksiya sababli, epithelial hujayralar nekrozi odatda arang seziladigan bo'ladi va basal membranalarning qiyinchilik bilan aniqlanadi. Kanalchalarning distal qismi va yig'uvchi naychalarda oqsil silindrлarni bo'lishi aspiratsion sindromdan dalolat beradi. Nekrozga uchragan va ko'chib tushgan hujayralar kanalchalarning pastki bo'limlariga o'tib boradi va silindrлarni hosil qilganligini kuzatdik. Zararlangan membrana atrofida limfositlar, makrofaglar to'planib qolganligini kuztish mumkin bo'ladi.

Xulosa: Buyrak to'qimasining mikroskopik tekshiruvlari neonatal davrda aspiratsion sindrom tashxisi bilan kasallanib nobud bo'lgan chaqaloqlar autopsiyasida ajratib olingan buyrak to'qimasini morfologik o'zgarishlarini o'rGANISHIMIZ shuni ko'rsatadi. Buyrakda qon aylanishi susaygan paytda ya'ni kislorod yaxshi yetib bormagan vaqtida boshlanadigan nekrotik o'zgarish ishemik kanalchalar nekrozi deb yuritiladi. Bunday holatda kanalchalarning proksimal qismi va Genle qovuzlog'ining pastga tushib boruvchi qismi zararlanganligini ko'rishimiz mumkin bo'ladi. Kanalchalar nekrozga uchrashi bilan o'tkir buyrak yetishmovchiligi boshlanganligidan dalolat beradi.

Kalit so'zlar: chaqaloq, neonatal davr, o'tkir buyrak yetishmovchiligi, gipoksiya, Ishemik nekroz, autopsiya

Mavzunihg dolzarbligi: Tug'ruqdan keyingi aspiratsiya sindromi neonatologiyada hali ham dolzarb tadqiqot mavzularidan biri bo'lib qolmoqda, klinik ahamiyatiga qaramay ko'pincha, yangi tug'ilgan chaqaloqlarda va chaqaloqlarda tug'ruqdan keyingi aspiratsiyaga hali ham kamroq e'tibor qaratilganligi kuzatilmoqda. Neoanatal davr shartli ravishda ikkita davrni o'z ichiga oladi. Bular erta neonatal davr bunda chaqaloq tug'ilganidan 0-7 kungacha bo'lган vaqtini o'z ichiga oladi. Ikkinchisi kechki neonatal davr 8-28 kungacha bo'lган muddatni o'z ichiga oladi. Neonatal davrda aksariyat ichki a'zolarning rivojlanishi xar qanday ta'sirlovchi omillarga javoban tizimli javob reaktsiyasi ko'rinishida namoyon bo'ladi. erta neonatal davrda chaqaloqlarda yuzaga keladigan aspiratsion sindromda ichki a'zolardan asosan parenximatoz a'zolarning gipoksiyasi kuzatiladi. Quyidagi tadqiqotimizda ushbu patologik o'zgarishlar buyrak to'qimasining posnatal ontogenetida quyidagi morfologik o'zgarishlar bilan rivojlanadi. Ya'ni yangi tug'ilgan chaqaloq buyragi nisbatan katta va yumaloq shaklda bo'ladi. U bo'laklardan iborat bo'lib, po'stloq qavati yaxshi rivojlanmaganligi uchun yuzasi g'adir-budur bo'ladi. Yangi tug'ilgan chaqaloq buyragi o'rtacha uzunligi 4.2 sm, kengligi uchlari sohasida 2.2 sm, darvoza sohasida 1.5 sm, og'irligi esa 12 g. Chap buyrak o'ngiga nisbatan katta. Chaqaloq buyragining po'stloq moddasini qalinligi o'rtacha 2 mm bo'ladi, mag'iz moddasiniki 8 mm bo'lib ularning bir-biriga nisbati 1:4 bo'ladi. Yangi tug'ilgan chaqaloq buyragining yuqori uchi XII ko'krak umurtqasining yuqori qirrasi sohasida joylashadi. Pastki uchi esa IV bel umurtqasining pastki qirrasi sohasida joylashadi. XII qovurg'a chap buyrakning yuqorigi uchini kesib o'tsa, o'ng buyrakning yuqorigi uchi XII qovurg'aning pastki qirrasiga to'g'ri keladi. Yangi tug'ilgan chaqaloq buyragi uch qavat g'ilof bilan o'ralgan. Buyrak fassiyasi qorinparda orqa fassiyasini yupqa varag'idan iborat. Buyrakning yog' pardasi yo'q. Buyrakning fibroz g'ilofi yupqa biriktiruvchi to'qimadan iborat bo'lib buyrak parenximasiga yopishib turadi va oson ajraladi. Yangi tug'ilgan chaqaloqning buyrak jomi keng, ampula shaklida bo'lib, ko'pincha buyrak tashqarisida joylashadi. Buyrak kosachalari homila hayotining oxirida paydo bo'ladi.

Ishning maqsadi tug'ruqdan keyingi erta hamda kechki neonatal davrda aspiratsion sindromdan vafot etgan chaqaloqlar buyragining postnatal ontogenetidagi rivojlanishining o'ziga xos morfologik o'zgarishlarini kuzatish.

Tadqiqot ob'ekti va predmeti. Respublika patologik anatomiya markazida 2020-2023 yillardagi tug'ruqdan keyingi neonatal davrda jami 48 nafar neonatal

ISSN (E): 2181-4570 ResearchBib Impact Factor: 6,4 / 2023 SJIF(2023)-3,778 Volume-1, issue-10

davrning erta (0-7 kunlik) davrida nobud bo'lgan chaqaloqlar va nobud bo'lgan chaqaloqlarning buyrak to'qimasi materiallari olingan.

Olingen natijalar. Buyrak to'qimasining mikroskopik tekshiruvlari neonatal davrda aspiratsion sindrom tashxisi bilan kasallanib nobud bo'lgan chaqaloqlar autopsiyasida ajratib olingen buyrak to'qimasini morfologik o'zgarishlarini o'rghanishimiz shuni ko'rsatadi. Buyrakda qon aylanishi susaygan paytda ya'ni kislorod yaxshi yetib bormagan vaqtida boshlanadigan nekrotik o'zgarish ishemik kanalchalar nekrozi deb yuritiladi. Bunday holatda kanalchalarning proksimal qismi va Genle qovuzlog'ining pastga tushib boruvchi qismi zararlanganligini ko'rishimiz mumkin bo'ladi. Kanalchalar nekrozga uchrashi bilan o'tkir buyrak yetishmovchiligi boshlanganligidan dalolat beradi. Bunga asosan kanalchalarning zararlanishi preglomerular arteriolalarnig tortishib, torayib qolishiga olib kelishi kuzatilishi mumkin. Bu esa koptokchalardagi filrlash tezligi pasayishiga olib kelishini kuzatish mumkin. Ishemik nekrozga uchragan buyrak to'qimasini mikroskop bilan tekshirib ko'rilganda kanalchalar qisqa segmentlarining zaralamganligi topildi. Epitelial hujayralar nekrozi odatda arang seziladigan bo'ladi va bazal membranalarning qiyinchilik bilan aniqlanadi. Kanalchalarning distal qismi va yig'uvchi naychalarda oqsil silindrлarni bo'lishi aspiratsion sindromdan dalolat beradi. Nekrozga uchragan va ko'chib tushgan hujayralar kanalchalarning pastki bo'limlariga o'tib boradi va silindrлarni hosil qilganligini kuzatdik. Zararlangan membrana atrofida limfositlar, makrofaglar to'planib qolganligini kuztish mumkin bo'ladi.

Xulosa. Respublika patologik anatomiya markazida 2020-2023 yillardagi tug'ruqdan keyingi neonatal davrda jami 48 nafar neonatal davrning erta (0-7 kunlik) davrida nobud bo'lgan chaqaloqlar va nobud bo'lgan chaqaloqlarning buyrak to'qimasi materiallari olingan. Buyrak to'qimasining mikroskopik tekshiruvlari neonatal davrda aspiratsion sindrom tashxisi bilan kasallanib nobud bo'lgan chaqaloqlar autopsiyasida ajratib olingen buyrak to'qimasini morfologik o'zgarishlarini o'rghanishimiz davomida kanalchalarning proksimal qismi va Genle qovuzlog'ining pastga tushib boruvchi qismi zararlanganligini ko'rishimiz mumkin bo'ldi. Kanalchalar nekrozga uchrashi bilan o'tkir buyrak yetishmovchiligi boshlanganligidan dalolat berdi.
